

**Amendments to the Abstract:**

Please replace Abstract with the following amended paragraph:

A communication system and method for enhancing the effectiveness of wireless and wired systems. The communication system comprising a communication management system performing dynamic switching of communication transceivers and dynamic addressing of communication devices within the network of communication devices with an extended caller identification system, ~~an integrated data scanner for scanned data in context with geographic location~~ to become a true unified communications system. ~~The communication management system ensures seamless and ubiquitous communication between wired and wireless devices. The communication system, when utilizing dynamic communication for wireless or wired roaming communications in conjunction with time of day scheduling, enhances the performance and effectiveness that are beneficial to most communication devices.~~
